**Plasma Cell in Peripheral Blood  
(Suspected to Plasma Cell Leukemia)**

This is a microscopic image of a peripheral blood smear. The field is populated with numerous red blood cells, which appear as uniform, pinkish-red discs. A single plasma cell is highlighted with a black rectangular box. This cell is characterized by a large, eccentric, dark blue nucleus and a prominent, lighter blue, foamy or vacuolated cytoplasm. The overall staining quality is high, with clear contrast between the cellular components and the background.
